

The potential of water voluntary carbon markets to mobilize finance for climate and water

Castalia, November 2023

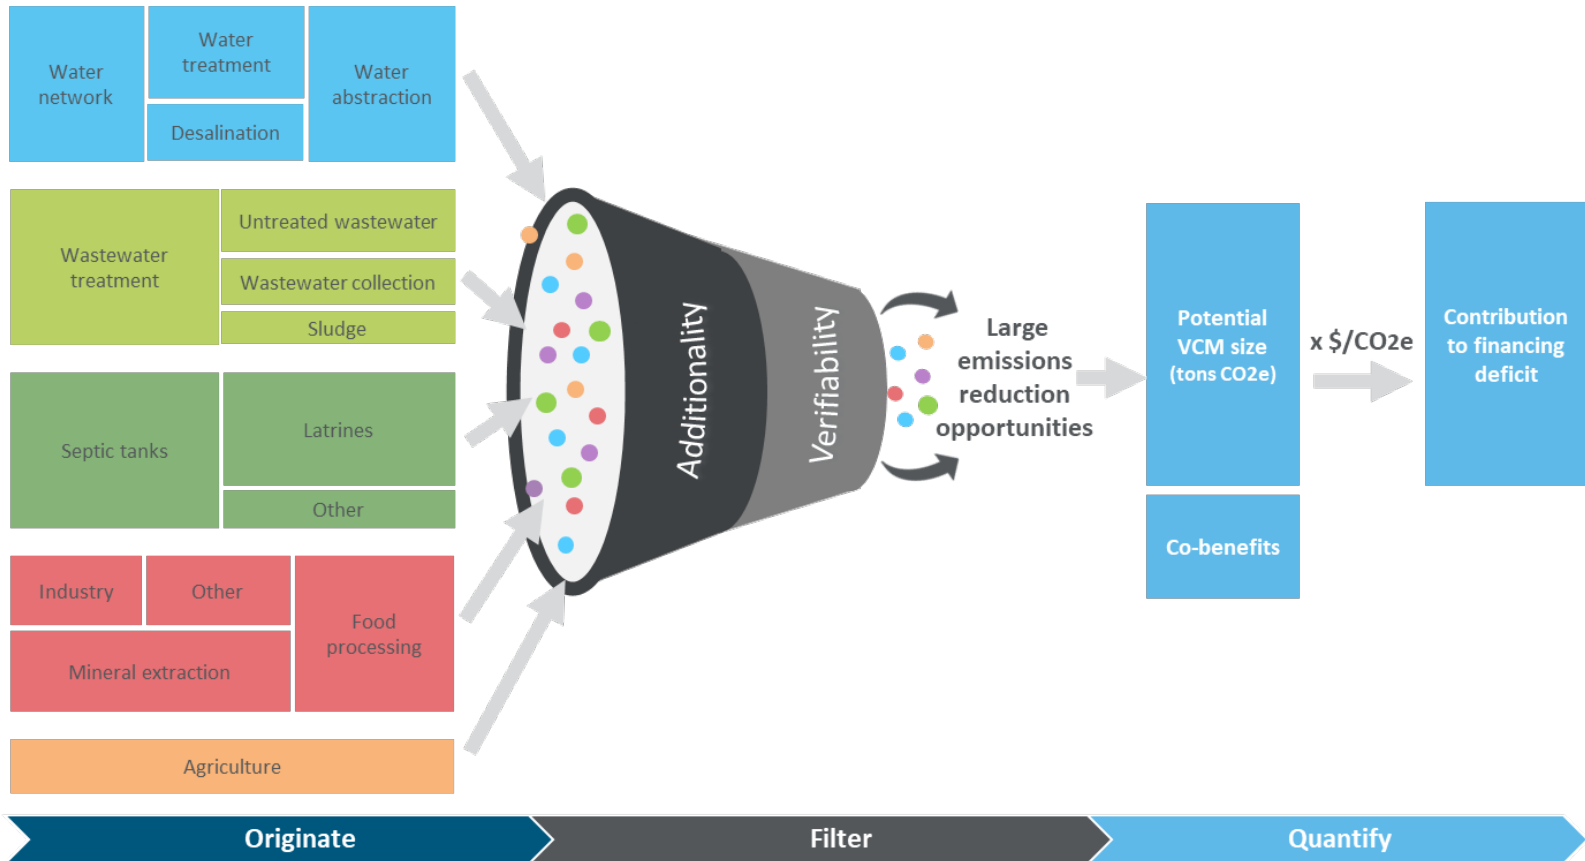

Voluntary carbon markets have the potential to reduce GHG emissions from the water sector by at least 445 MtCO₂e p.a.

- **The water sector emits about 2 billion tCO₂e p.a.**
- **Voluntary carbon markets could help catalyze a reduction of over 445 MtCo₂e p.a. ...**
- **by helping close financing gaps ...**
- **contributing as much as US \$10.6 b towards meeting SDG 6,**
- **yielding co-benefits of increased access and resilience in water services, better public health, and increased aquatic biodiversity**

Methodology

Water sector emissions typology

Six segments demonstrate the potential for climate and water benefits

Intervention	Verifiable & additional reduction potential (MtCO ₂ e)
Reducing water losses in piped systems	52
Pumping efficiency for piped water and sewage services	78
Distributed renewable energy for piped water and sewage services	340
Demand-side management for piped water supply	100
Maximum potential reduction from all grid electricity reduction measures	340
Reducing methane emission from wastewater treatment and discharge	3
Reducing methane emission from on-site sanitation value chain	102
Potential emissions reduction from the initiatives	445

Co-benefits

Based on proven models

Leakage control – Bahamas

The Water and Sewerage Corporation partnered with MIYA, a specialized water operator, to reduce leakage

Emission reduction: 25,617 tons CO₂e p.a.

Co-benefits

17 MLD saved
Improved utility cashflows
US\$ 16 million savings to government

Pumping Efficiency – Yerevan, Armenia

Yerevan's water utility used a performance-based contract with Acea to increase pumping efficiency and make other improvements

Emission reduction: 27,690 tons CO₂e p.a.

Co-benefits

30 percent reduction in electricity costs
Improved cashflows
Increase from 6h to 18h daily water supply

Wastewater CH₄ reduction—Santiago, Chile

Aguas Andinas, Santiago's utility, invested in a project to supply biogas from a wastewater treatment facility to the municipal gas utility.

Emission reduction: 19,788 tons CO₂e p.a.

Co-benefits

US\$ 1 million in profit from renewable energy certificate sales
The project was recognized as a Clean Development Mechanism

Citywide Desludging – Malindi, Kenya

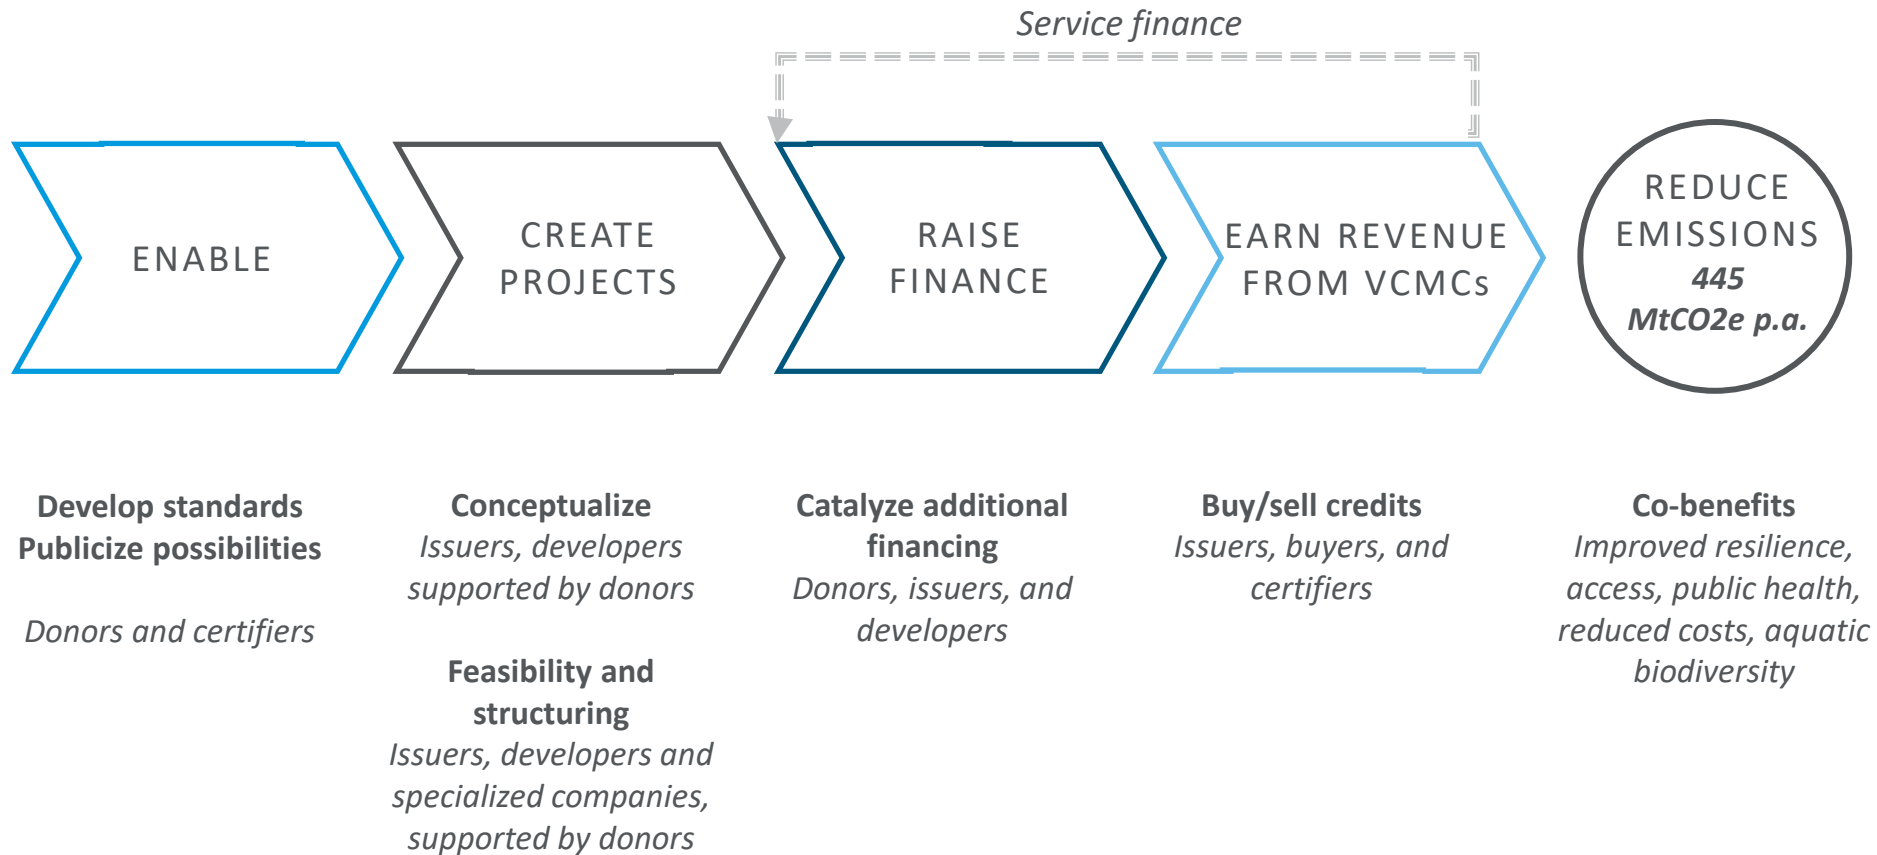

Proposed PPP for city-wide transport and emptying services of sludge to a fecal sludge plant to produce briquettes usable as cooking fuel

Projected **17 percent** reduction of sanitation-related methane emissions

Co-benefits

Replacement of CO₂ emissions from charcoal and firewood
Reduced deforestation and improved environmental management
Improved public health

There is an identifiable path forward

Let's do this together

- **445 MtCO₂e p.a. potential for additional, verifiable reductions from water services sector**
- **VCMs can help catalyze these reductions and \$10.6b toward closing the SDG6 financing gap**
- **Co-benefits will include improved resilience, access, public health, and aquatic biodiversity**
- **Multiple stakeholders in developing countries around the world will have to work together if this potential is to be achieved.**
